

## Git Workflow:

1. Creating a repository with master branch.
2. Creating further branches from the repository.
3. Creating, editing, renaming, moving, or deleting files.
4. Sending a pull request from one's branch with one's proposed changes to kick off a discussion.
5. Making changes on one branch as needed and the corresponding pulled request will update automatically.
6. Merging the pull request once the branch is ready to be merged.
7. Tidying up branches using the delete button in the pull request or on the branches page.
